RF Latex Slide Test for the detection of Rheumatoid factor in Human Serum

Read the pack insert before use provided along with the kit

INTENDED USE:
RF latex slide test is a latex agglutination test for qualitative and semi-quantitative in vitro determination of Rheumatoid Factor in human serum.

INTRODUCTION:
Immunologic factors are involved in both the articular and extra-articular manifestation of the disease. Rheumatoid Arthritis (RA) may represent an unusual host response to are or perhaps many etiologic agents. An infectious etiologic is possible, although it is not established. RA is a chronic, visually progressive inflammatory disorder of the joints. It is however, a highly variable disease that ranges from a mild illness of brief duration to a progressive, destructive polyarthritis associated with a systemic vasculitis. The incidence of RA is 1% to 2% in most population that have been studied. The disorder occurs worldwide but no definite racial, geographic or climatic variations. Womens are two to three times more likely than men to develop RA. It can begin at any age, but the disease initially occurs more frequently between the ages of 30 and 50 years. Complications due to an increased frequency of local or extra articular infections in RA patients have been demonstrated. Mortality may result from conditions such as septicemia, pneumonia, lung abscess or pyelonephritis. Rheumatoid factors are antibodies directed against antigenic sites in the Fc fragment of human and animal IgG. Their frequent occurrence makes them useful for the diagnosis and monitoring of the disease.

PRINCIPLE:
The RF kit is based on the principle of latex agglutination. Polystrene latex particles are coated with specially purified human gammaglobulin. When serum containing rheumatoid factors is mixed with the suspension of coated latex particles, visible agglutination occurs. The major advantage of this method is rapid performance and lack of heterophile antibody interference.

STORAGE AND STABILITY:

Storage:
Store the reagents at 2 to 8°C. Do not use the reagent beyond the expiry date mentioned on it. Before performing the test bring all the reagents to Room temperature. Replace the reagents to 2-8°C soon after performing the test. DO NOT FREEZE THE REAGENTS.

Stability:
1. The unopened kit is stable for 24 months from the date of manufacturing as indicated on the package.
2. The opened kit is stable for 3 months from the date of opening.
3. Repeated freeze thaw of reagents from 2 to 8°C to Room temperature several times will reduce the stability of the kit.

PACK SIZE: Available in packs of 25, 50, 100 Tests.

SPECIMEN:
Use fresh serum for testing. The specimen should be Non-hemolyzed and free from contamination. The specimen may be stored at 2 to 8°C for up to 8 days and at –20°C for up to 4 weeks. (Use EDTA, Heparin or Oxalate as anticoagulant).

SPECIMEN COLLECTION AND HANDLING:
Collect blood in a clean sterilized vial and allow it to clot. Separate the serum by centrifugation at 10000 rpm for 10 minutes at room temperature. It is recommended that fresh samples should be used. If serum is not used for testing immediately it should be stored at 2-8°C or Frozen at –20°C. Bring specimen to room temperature, and specimen should be mixed properly and centrifuged before use. Do not heat or repeatedly freeze thaw the specimens.

A. Qualitative Analysis:
1. Dilute the serum serially 1:2, 1:4, 1:8, 1:16, 1:32 using normal saline.
2. Place one drop of diluted sample using plastic dropper in each circle of the glass slide.
3. Add one drop of Latex Gammaglobulin reagent in each of these circles, mix well with applicator sticks.
4. Rock the slide gently to and fro for two minutes and examine for agglutination.

NOTE:
1. Liquid waste containing acid must be neutralized with a proportional amount of base prior to the addition of sodium hypochlorite.
2. Spills should be wiped thoroughly using either an iodophor disinfectant or sodium hypochlorite solution. Materials used to wipe up spills should be added to biohazardous waste matter for proper disposal.
3. Deterioration is indicated by a significant decrease by weak agglutination.
4. Do not use reagents after the expiration date printed on the label.
5. When removing reagents from the bottles, use aseptic technique to avoid contamination.
6. Mix the reagent bottle gently before use.
7. Do not use contaminated serum sample for testing.
8. Ensure used glass slide is disinfected, washed thoroughly and rinsed free of detergents.

TEST PROCEDURE:

A. Qualitative Analysis:
Allow all reagents as well as the sample to attain room temperature.
1. Using disposable plastic dropper place one drop of specimen in circled area of the slide provided in the kit.
2. Add one drop of Latex Gammaglobulin reagent to the above drop and mix well with disposable applicator sticks.
3. Rock the slide gently to and fro for two minutes and examine for agglutination. Do not examine beyond two minutes. For Positive and Negative controls follow the same procedure as mentioned above by taking control serum from respective vials.
B. Semi quantitative Analysis:
1. Dilute the Test serum serially 1:2, 1:4, 1:8, 1:16, 1:32 using normal saline.
2. Place one drop of diluted sample using plastic dropper in each circle of the glass slide.
3. Add one drop of Latex Gammaglobulin reagent in each of these circles, mix well with applicator sticks.
4. Rock the slide gently to and fro for two minutes and examine for agglutination.

INTERPRETATION OF RESULTS:
Read the result under strong source of light.

A. Qualitative Analysis:
Negative: Uniform milky suspension with no agglutination.
Positive: Any observable agglutination in the reaction mixture.

B. Semi Quantitative Analysis:
Concentration of Rheumatoid Factor can be estimated in IU/ml as follows:
RF in IU/ml = Sensitivity in IU/ml x Titre
Where Sensitivity = 20 IU/ml Titre = Reciprocal of the highest dilution of serum which exhibits a positive reaction.

TROUBLESHOOTING:

LIMITATIONS OF THE TEST:
1. Make sure that the cap of each reagent vial is properly and promptly applied to the same vial. Interchanging of the vial caps and or droppers will lead to contamination of reagents, which might lead to false results.
2. The slide should be tilted back and forth gently to avoid disturbance to the reaction pattern.
3. Contaminated blood specimen or reagents may interfere with test results. Peripheral drying in slide test should not be misinterpreted as agglutination.
4. The reagents contain sodium azide as preservative. Do not swallow. Avoid contact with skin and mucous membrane.

REFERENCE:

NOTE:: Even after the best effort is made to supply the product as per the sample submitted but due to continuous R & D, the company reserves the right to improve/change any specifications/components without prior information/notice to the buyer.

LIMITED EXPRESSED WARRANTY OF MANUFACTURER
The manufacturer limits the warranty to this test kit, as much as that the test kit will function as an in vitro diagnostic assay within the Nature of Sample, Procedure limitations and specifications as described in the product instruction manual, when used strictly in accordance with the instructions contained. The manufacturer disclaims any warranty expressed or implied including such expressed or implied warranty with respect to merchantability, fitness for use or implied utility for any purpose. The manufacturer’s liability is limited to either replacement of the product or refund of the purchase price of the product and in no case liable to claim of any kind for an amount greater than the purchase price of the goods in respect of which damages are likely to be claimed. The manufacturer shall not be liable to the purchaser or third parties for any injury, damage or economic loss, howsoever caused by the product in the use or in the application there of.
